

SIMPLE FLOW GUIDE — HOW
EVERYTHING WORKS

UTech Automation ERP

A plain-language handbook for factory staff, supervisors and managers. In short sentences and everyday words, it shows how an enquiry becomes a quotation, how work is planned and checked, and how goods leave the gate with a correct invoice — while stock stays right at every step.

U-Tech Automation Industries

6. Masters — The Foundation	7
7. Who Can Do What — Roles & Permissions	7
8. Reports & Tally Export	8
9. Glossary	8
10. Quick Start for a New User	9

This guide uses only everyday words. Where a factory word is unavoidable - like **GRN** or **BOM** - it is explained the first time it appears, and again in the Glossary at the end.

1. What is UTech ERP?

UTech ERP is one computer program that keeps all the factory's records in one place. You open it in your web browser, just like a website, so there is nothing to install on your computer. Instead of paper notebooks and separate spreadsheets, everyone works on the same records at the same time. When one person saves a change, the others see it straight away. The system also does the dull work for you: it gives every document its own number, adds up money and tax, and keeps stock counts correct.

Here is what you can do with it:

- Write **quotations** (price offers) and **invoices** (bills) for customers.
- Plan work with **job cards** and follow progress on the shop floor.
- Send material out for work and receive it back with a **jobwork challan**.
- Record everything that comes into or goes out of **stock**.
- Check the **quality** of what you receive and what you make.
- Print **reports**, and hand the accounts over to **Tally**.
- Decide **who is allowed** to see and do what, with roles.

The rest of this guide walks through each of these in order, in the same sequence a real order follows.

2. The Big Picture

Every order in the factory follows the same path, from the first phone call to the money in the bank. The drawing below shows the nine stages and how one leads to the next. Follow the numbers: the top row goes left to right, then the flow continues on the second row.

The nine stages of an order, from first question to final payment.

- **1. Enquiry** — a customer asks: “Can you make this part, and what will it cost?”
- **2. Quotation** — you write down what will be supplied and at what price, and send it (Masters → Quotations).

- **3. Sales Order** — the customer says yes. In UTech, the approved quotation is the agreed order.
- **4. Job Card** — the office plans the work: what to make, how many, which materials and machines (Masters → Jobcards).
- **5. Jobwork** — material moves to where the work happens: our shop floor, or a vendor who sends it back done.
- **6. Quality Check** — good pieces are counted into stock; rejected pieces are not.
- **7. Dispatch** — finished goods leave for the customer with a dispatch challan (Sales → Dispatch).
- **8. Invoice** — the bill, with tax added automatically (Sales → Invoices).
- **9. Payment** — money received is recorded on the invoice until it shows Paid.

A **challan** is simply the paper that travels with goods when they move. You will meet three of them: jobwork challan (material out to a vendor), dispatch challan (goods out to a customer) and GRN (goods in from a vendor).

3. The Sales Journey, Step by Step

This chapter follows one order through the system. For each stage it says **who** usually does it, **what to click** (the menu names are the real ones in the program) and **what the system does by itself**. A small step list and a summary table close the chapter.

3.1 Write the quotation — sales person

1. Go to **Masters → Quotations** and open a new quotation.
2. Pick the customer, then add items, quantities and prices.
3. Save. The system gives the quotation its own number, like **QT-26-00001** (QT for quotation, 26 for the year), and marks it **Draft**.
4. When the customer receives it, mark it **Sent**. When they agree, mark it **Approved**. If they refuse, mark it **Rejected**.

3.2 The customer says yes — the sales order

There is no separate “sales order” paper to make. The approved quotation **is** the order, and work is planned from it. Later, when the bill is made, the quotation is marked **Converted** so nobody bills the same order twice.

3.3 Plan the work: the job card — planner or supervisor

1. Go to **Masters → Jobcards** and open a new job card.
2. Choose the customer and the item to make, add the materials and the operations (the steps of work), and set a due date and a priority.
3. Save. The system gives it a number like **JC-26-00001** and marks it **Draft**.

4. Start the job when work begins (**In Progress**), hold it if you must wait (**On Hold**), and complete it when done. Workers add short progress notes as they go.

The **Assignments** page (Masters → Assignments) hands each task to a named person, so everyone knows their part.

3.4 Material moves: jobwork — store and production

If the work is done inside the factory, the job card guides the shop floor. If it is done by a vendor (an outside supplier who works for you), use a jobwork challan:

1. Go to **Customer Inventory → Vendor Dispatch (Jobwork)** and open a new jobwork challan.
2. List the material that travels to the vendor. The system gives it a number like **JW-26-00001** and marks it **Issued**.
3. Stock goes **down** when the material leaves, and back **up** when it returns processed. The status moves from **Issued** to **Partly Received** to **Received**.

3.5 Check quality — quality or store person

Before goods count as good stock, they are checked. When a delivery is received, the person receiving it enters **accepted** and **rejected** quantities. Full inspections with measurements can be recorded on the **Quality** page. The system only counts accepted pieces into stock, so bad material never hides on the shelves.

3.6 Send the goods: dispatch — store or dispatch person

1. Go to **Sales → Dispatch** and open a new dispatch challan.
2. Pick the customer, the items and the quantities leaving the gate.
3. Save. The system gives a number like **DC-26-00001** and stock goes **down** at once — a draft challan holds the goods aside so nobody sells them twice.
4. Mark the challan **Delivered** when the customer receives it.

3.7 Make the bill: invoice — accounts

1. Go to **Sales → Invoices** and open a new invoice.
2. Pick the customer and the items with their rates. **GST** (the goods and services tax) is calculated for you, line by line.
3. Save. The invoice gets a number like **INV-26-00001** and starts as **Draft**. Issue it when it is final.
4. Shortcut: open an approved quotation and use **Convert** — the invoice is made from it with the items already filled in.

3.8 Receive the money: payment — accounts

1. Open the invoice and choose to add a payment. Enter the amount, the date and how the money came (cash, bank, and so on).
2. The invoice status moves to **Partly Paid**, then **Paid**. Invoices left unpaid too long show as **Overdue** on the dashboard.

Stage	Where in the menu	Number given	System does automatically
Quotation	Masters → Quotations	QT-26-00001	Numbering; status Draft → Sent → Approved
Sales order	the approved quotation	n/a	Marked Converted when billed
Job card	Masters → Jobcards	JC-26-00001	Numbering; status; progress notes
Jobwork	Customer Inventory → Vendor Dispatch (Jobwork)	JW-26-00001	Stock out and back in; status
Dispatch	Sales → Dispatch	DC-26-00001	Stock down; status → Delivered
Invoice	Sales → Invoices	INV-26-00001	GST and totals; status → Issued
Payment	on the invoice page	n/a	Status → Partly Paid → Paid

The sales journey at a glance. Every document gets its own number in the same way.

4. Buying from Vendors, Step by Step

Sometimes you buy material, or ask a vendor to do work for you. Four papers tell this story: the **vendor work order** (what you asked for), the **purchase order** (what you agreed to buy), the **GRN** (what actually arrived) and, if needed, the **purchase return** (what went back).

4.1 Tell the vendor what you need

1. Go to **Customer Inventory → Vendor Work Orders** and open a new one.
2. Write what material or work you expect back, and from which vendor. It gets a number like **VWO-26-00001**. Mark it **Sent** when the vendor has it.
3. As replies come in, the status moves to **Partly Received** or **Received**; when the job is finished for good, it is **Short Closed**.

4.2 Make the purchase order (PO)

1. From the vendor work order, or from **Company Inventory → Purchase Orders**, create a purchase order. It gets a number like **PO-26-00001**.
2. A new PO waits as **Pending Approval**. A manager approves or rejects it. Only an **Approved** PO can be received against.

4.3 Material arrives: the GRN

GRN means Goods Received Note — the record made every time a delivery comes in. It is the most-used paper in buying, so it is worth remembering.

1. Go to **Company Inventory → GRN (Stock In)** and open a new GRN.
2. Pick the purchase order, then enter what arrived: received quantity, how many pieces are **accepted**, how many **rejected**.
3. Save. The GRN gets its own number and **stock goes up** by the accepted quantity, straight away.
4. The purchase order now shows how much has arrived (**Partly Received**, then **Received**). If the PO came from a vendor work order, that work order moves ahead by itself too — nothing to link by hand.

4.4 Something wrong? Send it back

If material must go back to the vendor, make a purchase return: **Company Inventory → Purchase Returns**. List the items and quantities leaving, and get it approved. When the return is processed, **stock goes down** to match what physically left the store. Customer returns work the same way in reverse (Sales → Returns): goods come back and stock goes up.

Remember: the GRN is where buying meets stock. No GRN, no stock — nothing counts as received until it is written down on one.

5. Keeping Stock Correct

Stock is the material and finished goods you hold right now. In UTech you never type a stock number by hand — the count changes by itself when documents are made. Every change is also written into a diary called the **stock ledger**, so you can always see who changed what, when, and why.

This happens...	Stock	Because...
A GRN is saved (accepted pieces)	goes UP	material has physically arrived
Processed material returns from a vendor jobwork	goes UP	the challan is being received back
A production batch is completed	goes UP	finished goods have been made
A customer returns goods (Sales → Returns)	goes UP	goods came back into the store
A dispatch challan is made	goes DOWN	goods are held aside for the customer
Material is issued on a jobwork challan	goes DOWN	material left for the vendor
A production batch uses material	goes DOWN	consumption is booked at completion

This happens...	Stock	Because...
A purchase return is processed	goes DOWN	goods went back to the vendor

What moves stock up or down — and the simple reason behind each move.

Where to see live stock: open **Stock Management → Stock Overview & Ledger**. It shows the current quantity of every item, the full history of movements for each one, and it is also where reports of stock are downloaded. When an item runs low, the system raises a low-stock notification so you can reorder in time.

One careful point: material that belongs to a customer (given to us for processing) is counted separately, under **Customer Inventory → Customer Material**. It never mixes with our own stock.

6. Masters — The Foundation

Masters are the fixed lists the whole factory shares: the customers, the items, the machines and so on. They are filled in once and used everywhere. A quotation, a job card and an invoice all pick the same customer and items from these lists — that is why names and spellings stay tidy. If something is missing on a screen, the fix is usually to add it to a master first.

Master	Where in the menu	What it holds
Parties	Masters → Parties	Customers and vendors: address, phone, GSTIN (the tax number of a business) and their account balance
Items	Company Inventory → Items	Everything you buy, make or sell — with its unit (pieces, kg, metres) and its current stock
Machines	Masters → Machines	The machines in the factory that work can be planned on
Processes	Masters → Processes	The kinds of work a job can go through, like cutting or welding
Departments	Admin → Departments	The sections of the factory (and the Department Roles inside them)
BOM	Company Inventory → BOMs	Bill of Materials — the recipe of a product: every part and quantity needed to make one piece
Users & Roles	Admin → Users / Roles	The people who log in, and what each one is allowed to do

The master lists and where each one lives in the menu.

7. Who Can Do What — Roles & Permissions

Think of a **permission** as one named right — for example, “create an invoice”. A **role** is a bundle of these rights given to a job title. Your role decides which menus and buttons you see at all: if a menu is missing, that is on purpose, not a fault. This keeps confidential pages (like costs and users) away from people who do not need them.

Role	In plain words
SUPERADMIN	Sees and does everything. One such account is set up when the system is installed.
Admin	Creates users, gives out roles, and looks after the whole system.
Plant Head	Sees the whole plant: all departments, all numbers.
Manager	Runs day-to-day operations — sales, purchases, production pages.
Project Engineer	Follows the projects assigned to them, nothing else.
Department Head, Supervisor, Team Leader	See and run the work inside their own department only.
Operator	Sees only a personal dashboard and the assignments given to them.

The seeded roles and what they may do. Your company may use only some of them.

Admins create accounts under **Admin → Users**: press New User, fill the name, email, role and department, and save. The new person receives a way to sign in and should set their own password at first login. A user can change their password any time from their profile menu.

8. Reports & Tally Export

Reports turn your records into files you can read, print or email. Open **Analytics → Reports** and download a ready-made Excel file of what you need — no copy-pasting from screens. The three Analytics pages next to it draw the same numbers as charts: Sales Analytics, Production Analytics and Inventory Analytics.

- **Invoices, Jobcards, Items, Expenses** — the full lists, for checking or meetings.
- **Party ledger** — every bill and payment of one customer or vendor, on one sheet.
- **Stock ledger** — every movement that changed stock, with dates.
- **Customer stock and vendor stock** — what material is lying with customers or at vendors.

Tally export is a bridge to the accountant. Tally is the accounting software most Indian accountants use. Instead of retyping invoices into Tally, UTech can export a file Tally understands: the **masters** (your parties and items) and the **vouchers** (invoices, receipts and payments) for any date range. Your admin sets it up once; after that it is a simple download-and-import job, and the account books match the factory records.

9. Glossary

Every special word used in this guide, in one place. If a word on a screen confuses you, look it up here.

Word	Simple meaning
Quotation	A written price offer to a customer: what will be supplied and for how much.
Sales Order	A customer's confirmed order. In UTech it is the approved quotation.
Job Card	The plan for one manufacturing job: item, materials, steps, due date, priority.
Jobwork	Work sent out to a vendor, with a challan; the material goes out and comes back done.
GRN	Goods Received Note — the record that a delivery has arrived; it raises stock.
Dispatch	Goods sent to a customer, with a dispatch challan; it lowers stock.
Invoice	The bill for goods or services, with GST added.
Payment	Money received, recorded on an invoice until it shows Paid.
BOM	Bill of Materials — the recipe of a product: all parts and quantities to make one.
GST	Goods and Services Tax — the tax added to most sales in India.
GSTIN	The tax registration number of a business (every registered company has one).
HSN	A standard code that says what kind of product an item is; used on invoices.
Party	Any business you deal with — a customer or a vendor.
Master	A shared list everyone picks from, like Items or Parties.

10. Quick Start for a New User

New to UTech? This page is all you need for day one. First, ask your admin for your own user name (an email) and a starting password. Never use another person's login — your name is stamped on everything you do.

10.1 Sign in

1. Open the UTech web address in your browser (your admin will give you the link).
2. Type your email and password, and press Sign in.
3. You land on the **Dashboard** — the home screen.

10.2 Change the password on day one

The system comes with one ready-made admin account (**admin@utech.local**) — the person who installed the system knows its password. If you are that person, change this password the same day: open your profile menu (top-right corner) and choose the change-password option. Every other user should set a personal password at their first login too.

10.3 Read the dashboard

The dashboard is the factory at a glance. The cards on top show recent sales, active job cards, pending jobwork, overdue invoices, and how many parties and items are on record. Below them, charts show sales month by month and how stock is spread across categories. If a number looks wrong, click it — it usually leads to the list behind it.

10.4 The first three things to try

1. Find yourself: go to **Admin → Users** and open your own name. Check your role — it decides what you can see.
2. Open a customer: **Masters → Parties**, click any name, and look at the details and the ledger behind it.
3. Watch stock move: **Stock Management → Stock Overview & Ledger**, pick an item, and read its diary of movements.

Missing a menu? Your role does not include it — ask your admin. **Stuck?** The Glossary on the previous pages explains every word the screens use.
